Δήλωση συμφερόντων

Τα τελευταία 2 έτη έχω λάβει τιμητική αμοιβή από τις εταιρείες: Lilly, AENORASIS, SOBI, GSK, AstraZeneca, Pfizer

Για τη συγκεκριμένη ομιλία έχω λάβει τιμητική αμοιβή από την GSK

Κλινική Περίπτωση

- Woman 33 years old, nulliparous
- History of hypothyroidism

- **Diagnosed with SLE** in 2011: ANA 1:320+, anti-dsDNA+, anti-Ro/SSA+, arthritis, thrombocytopenia (>70.000/mm^3), acute cutaneous lupus, hair loss/alopecia,
- In 2013, she developed kidney disease (**minimal change disease**) attributed to lupus, and she responded very well to glucocorticoids (18 months' course) and azathioprine

- 2015-2016: **repeated episodes of active rash and arthritis**, managed with short course of glucocorticoids. Azathioprine was temporarily switched to methotrexate, which was not tolerated (GI distress)

- On 02/2016 she presented with an **acute flare**:
  - Fever >38, fatigue, rash (ACLE) over the trunk and upper arms, hair loss, arthritis (wrists, MCPs, MTPs), ↑ anti-dsDNA, ↓ C3/C4, ↑ ESR/CRP
  - Treatment: HCQ 400 mg/d, azathioprine 150 mg/d
  - She received pulses IV methylprednisolone (2 grams) followed by oral prednisone (30 mg/day, gradually tapered to 7.5 mg/day after 3 months)

Κλινική Περίπτωση

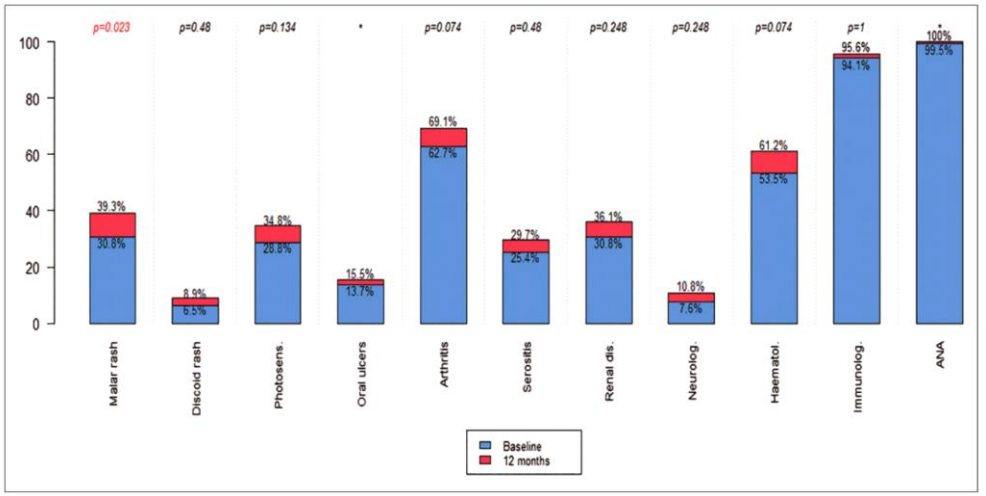
- During the next months, the patient experienced
  - 3 additional **relapses of SLE** (arthritis, fever, rash) at a prednisone dose of 7.5-10 mg/day
  - She also had lymphopenia (1000/μL), serological activity (↑ anti-dsDNA, ↓ C3/C40 and ↑ ESR/CRP
  - All flares were treated **with increases in glucocorticoids** while **ciclosporin was added to azathioprine**

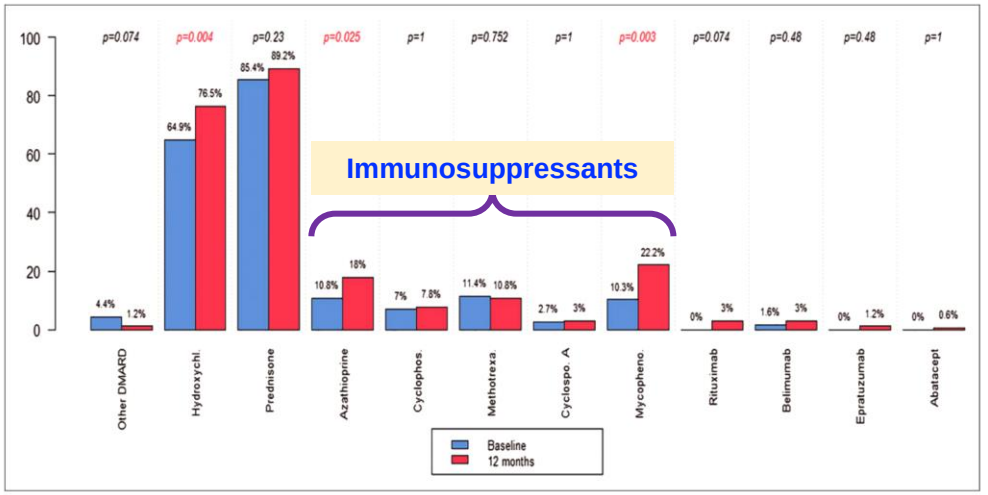
- On 06/2017:
  - While on treatment with HCQ 400 mg/day, azathioprine 150 mg/day, ciclosporin 100 mg/day, prednisolone 10 mg/day, she developed left pleurisy
  - Chest CT reveled **mild/moderate pleural effusion** (left) and mild pericardial effusion. She still had serological activity, and residual activity from skin, joints

Φυσική πορεία του ΣΕΛ κατά τα πρώτα έτη μετά τη διάγνωση

Prognosis during the first year

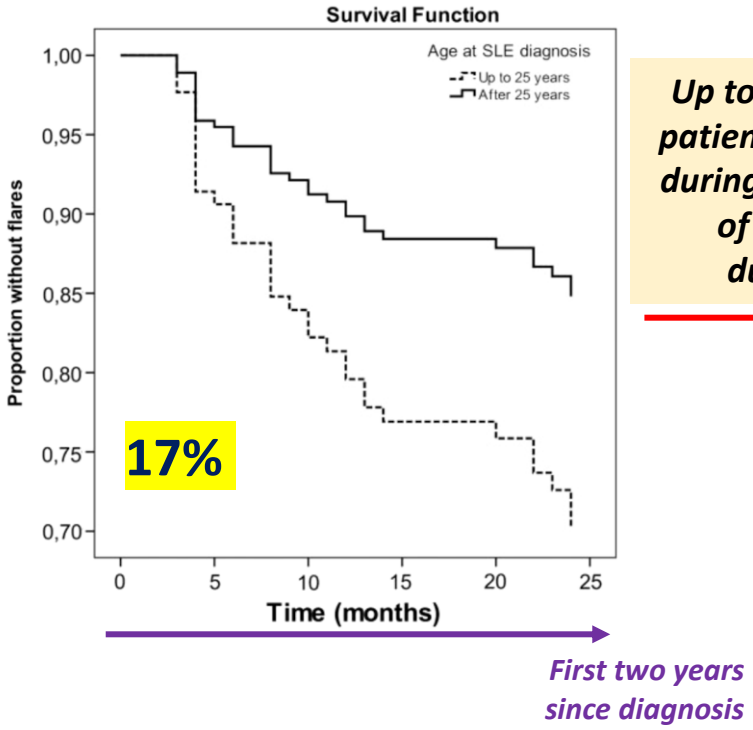
- 20-30% των ασθενών έχουν ήπια πορεία με το υπόλοιπο ποσοστό να μοιράζεται μεταξύ μετρίως σοβαρής και πολύ σοβαρής νόσου
- Accrual of **new manifestations** and organ involvement
- Increased **need for treatments** (glucocorticoids, immunosuppressants)
- **Only about 35% of patients achieves clinical remission**





Sebastiani GD, et al. *Lupus*. 2018; 27: 1479-88
Piga M, et al. Rheumatology. 2020; 59: 2272–81
Segura BT, et al. Rheumatology. 2020; 59: 524–33
Koelmeyer R, et al. Lupus Sci Med. 2020; 7: e000372

Οι υποτροπές είναι συχνές και επιδρούν αρνητικά στην πρόγνωση της νόσου



Up to 60-70% of patients will flare during 5-10 years of disease duration

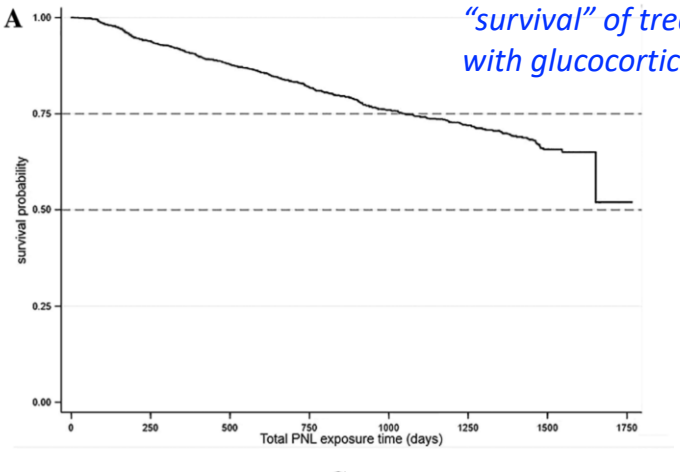
Ασθενείς «υψηλού κινδύνου» για εξάρσεις

- Younger patients
- High disease activity (SLEDAI ≥12)
- Immunological activity (↑ anti-dsDNA, ↓ C3/C4)
- Renal, CNS, hematological disease, vasculitis
- Non-use of hydroxychloroquine
- Poor adherence to treatment
- (Premature) discontinuation of immunosuppressive treatment

Ines L, et al. *Rheumatology*. 2014; 53: 85-9
Ugarte-Gil MF, et al. *Lupus*. 2018; 27(4): 536-44
Petri M, et al. *Arthritis Rheum*. 2013; 65(8): 2143-53

More than 50% of patients remain on GC treatment after more than 4 years of follow up

- **Asia-Pacific Collaboration SLE cohort**
- **2860 patients, >19800 visits**
- **Mean follow-up: 2 years**
- **30.5% had SLEDAI-2K >4 at baseline**
- **48% developed at least one flare**
- **12% accrued new organ damage**

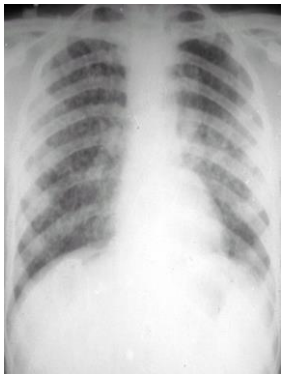


"survival" of treatment with glucocorticoids

Immunosuppressives were more frequently discontinued as compared to glucocorticoids, espically in patients with moderate activity !!

Kandane-Rathnayake et al. *Arthritis Care Res*. 2022; DOI 10.1002/acr.24740

Βλάβη οργάνων & συννοσηρότητες

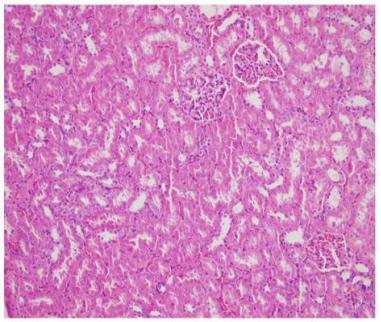


Fibrosis

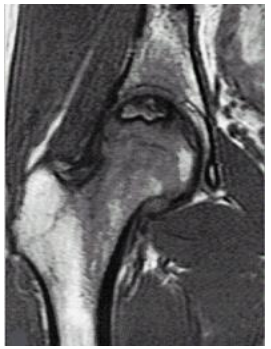
Muscle atrophy

Osteoporotic fractures

Atherosclerosis (MI, CVD)



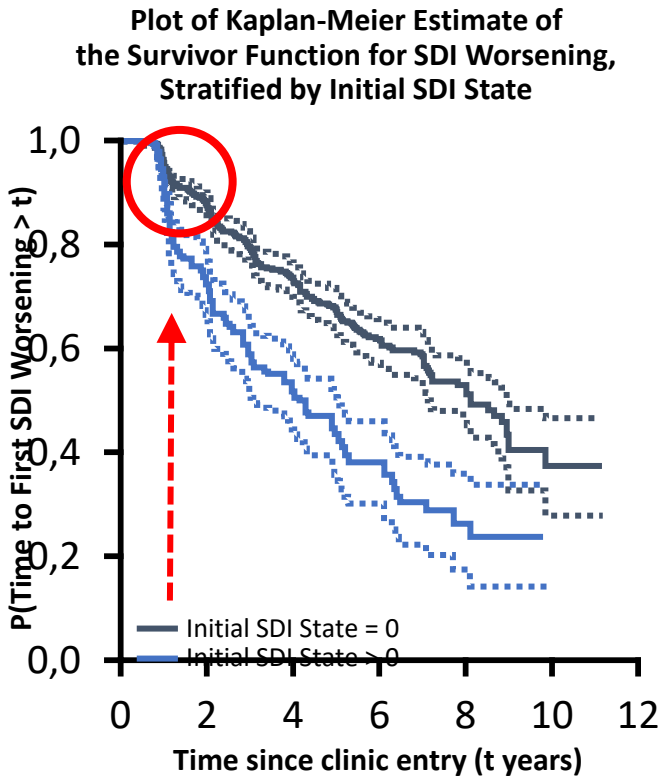
Kidney fibrosis-atrophy



Osteonecrosis

Jönsen A, *et al.* *Arthritis Care Res* 2011; **63**:1233–1237; Yurkovich M, et al. Arthritis Care Res 2014; **66**:608–616

Up to 40-50% of SLE patients accrue organ damage within 7 years since diagnosis



- **Damage develops in <u>15–20% of SLE patients within the first two years since disease diagnosis</u>**
- **Crete SLE Registry**: 32% after mean follow-up 7 years
- **Attikon SLE Registry**: 17.8% within 6 months from diagnosis
- Most frequently afflicted organs: eyes, skin (atrophy), MSK (osteop. #), neurological, cardiovascular (MI/angina) etc.

Bruce IN, et al. *Ann Rheum Dis*. 2015; 74:1706-13; Pego-Reigosa JM, et al. *Rheumatology (Oxford)*. 2016 (epub); Conti F, et al. *Lupus*. 2016; 25: 719–726; Gergianaki I, et al. *Ann Rheum Dis*. 2017; 76(12):1992-2000; Nikolopoulos D, et al. *Lupus*. 2020; 29(5): 514–522

Φυσική πορεία του ΣΕΛ

1. Προσβολή νέων οργάνων
2. Αύξηση τίτλων αυτοαντισωμάτων
3. Εξάρσεις νόσου – αυξημένη ενεργότητα
4. Ανάγκη χρήσης ανοσοτροποποιητικών/ανοσοκατασταλτικών φαρμάκων
5. Μακροχρόνια χρήση γλυκοκορτικοειδών
6. Μη-αναστρέψιμη βλάβη οργάνων

Reduced quality of life (QoL) in patients with SLE

✓HRQoL is reduced in SLE patients[1-4] . Only partially related to disease activity → rather, associated with pain, fatigue and other patient-related factors

✓The extent of this reduction is **comparable to severe medical illnesses**, including AIDS, Sjogren's syndrome and RA , psoriatic arthritis, congestive heart failure, post-myocardial infarction[2,3,4]

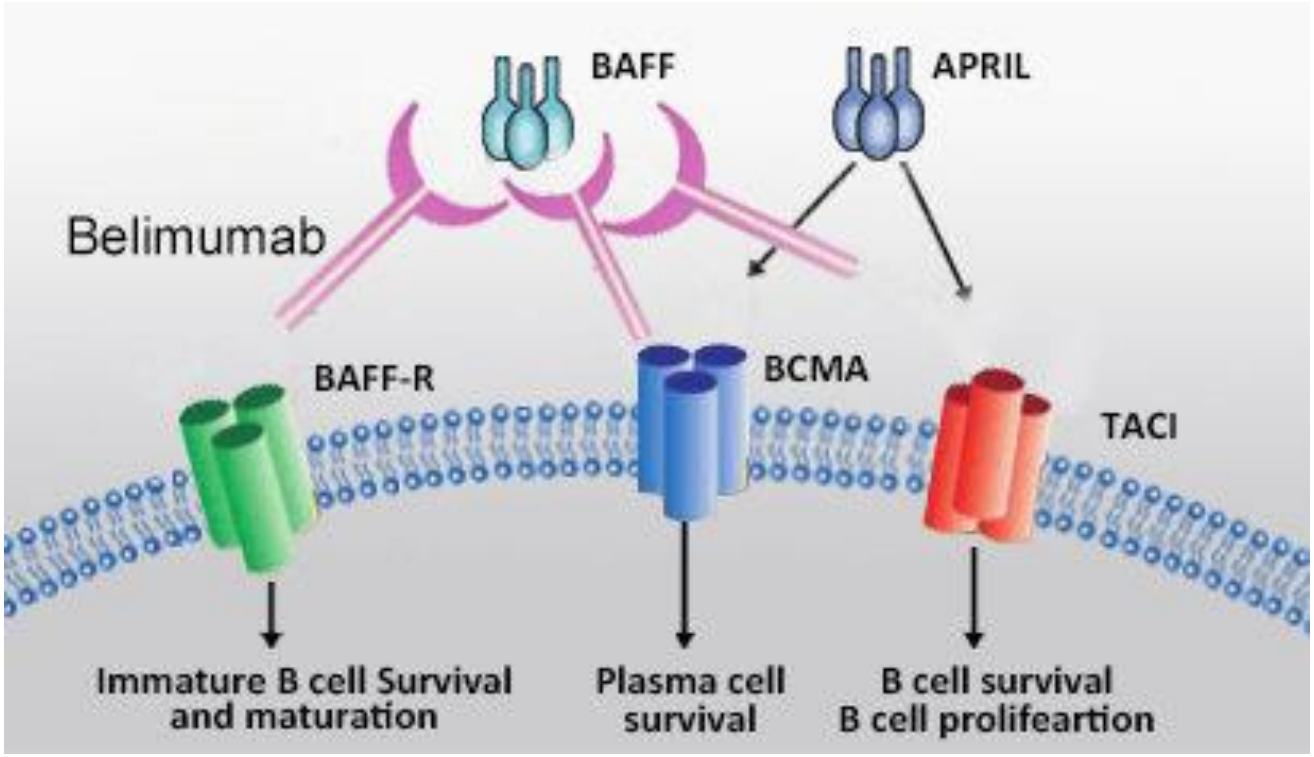
Targeted (biologic) therapies in SLE

- Tailored to the underlying pathophysiology of the disease
- Indicated as ‘add-on’ therapy especially for cases with **incomplete disease control under ‘standard-of-care’ treatment**

- **Belimumab** (anti-BAFF)
- **Anifrolumab** (anti-IFNAR)
- Rituximab, Obinutuzumab (B-cell depletion)
- Other treatments under development

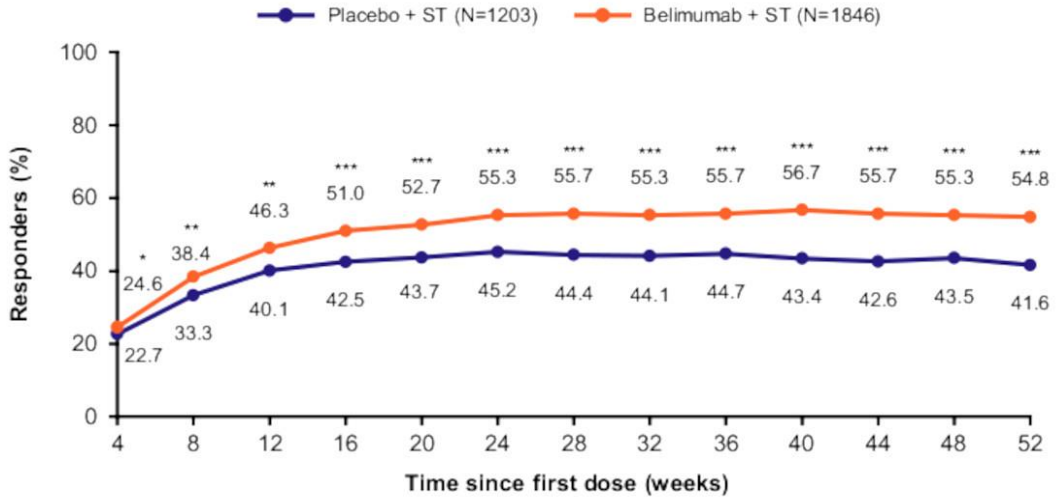
Belimumab (anti-BAFF mAb)



Αθροιστικά δεδομένα αποτελεσματικότητας από τις τυχαιοποιημένες κλινικές δοκιμές

(n=1217 SoC, n=1869 BEL+SoC)

Figure 2. SRI-4 response over 52 weeks in the overall population



Number of patients with SRI-4 response

	4	8	12	16	20	24	28	32	36	40	44	48	52

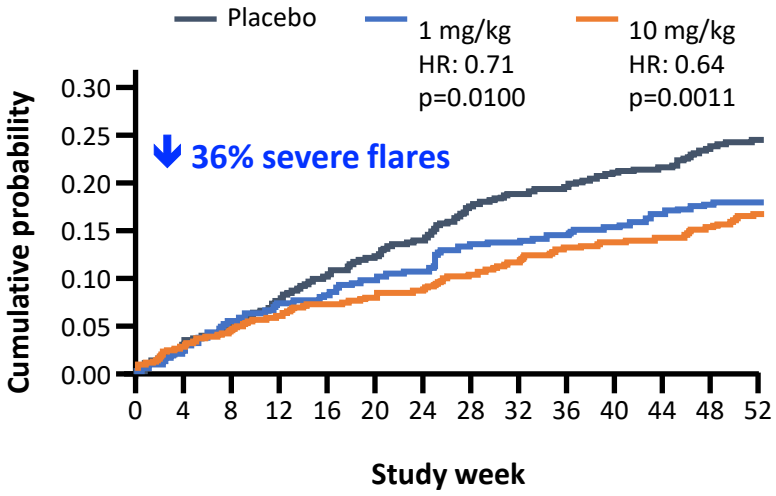
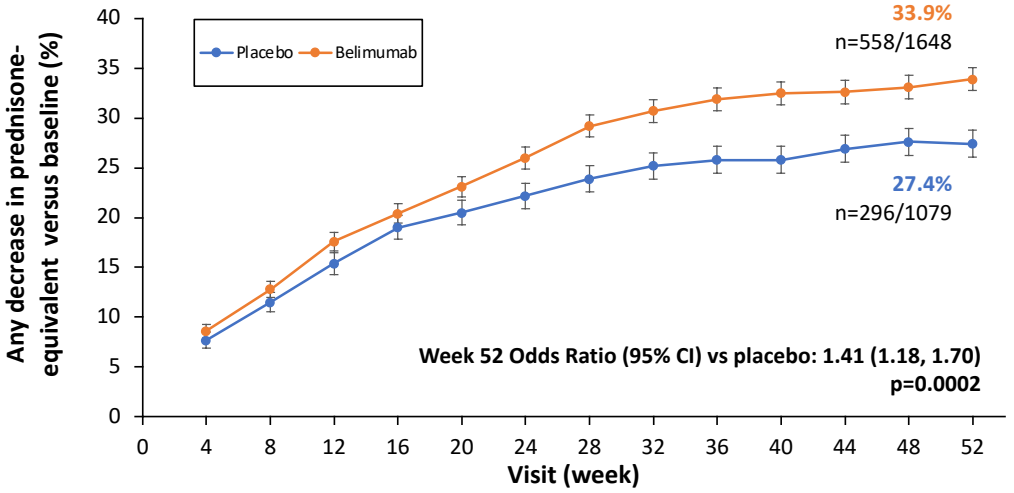
Belimumab helps to stabilize SLE and reduce the need for glucocorticoids

Prevention of flares

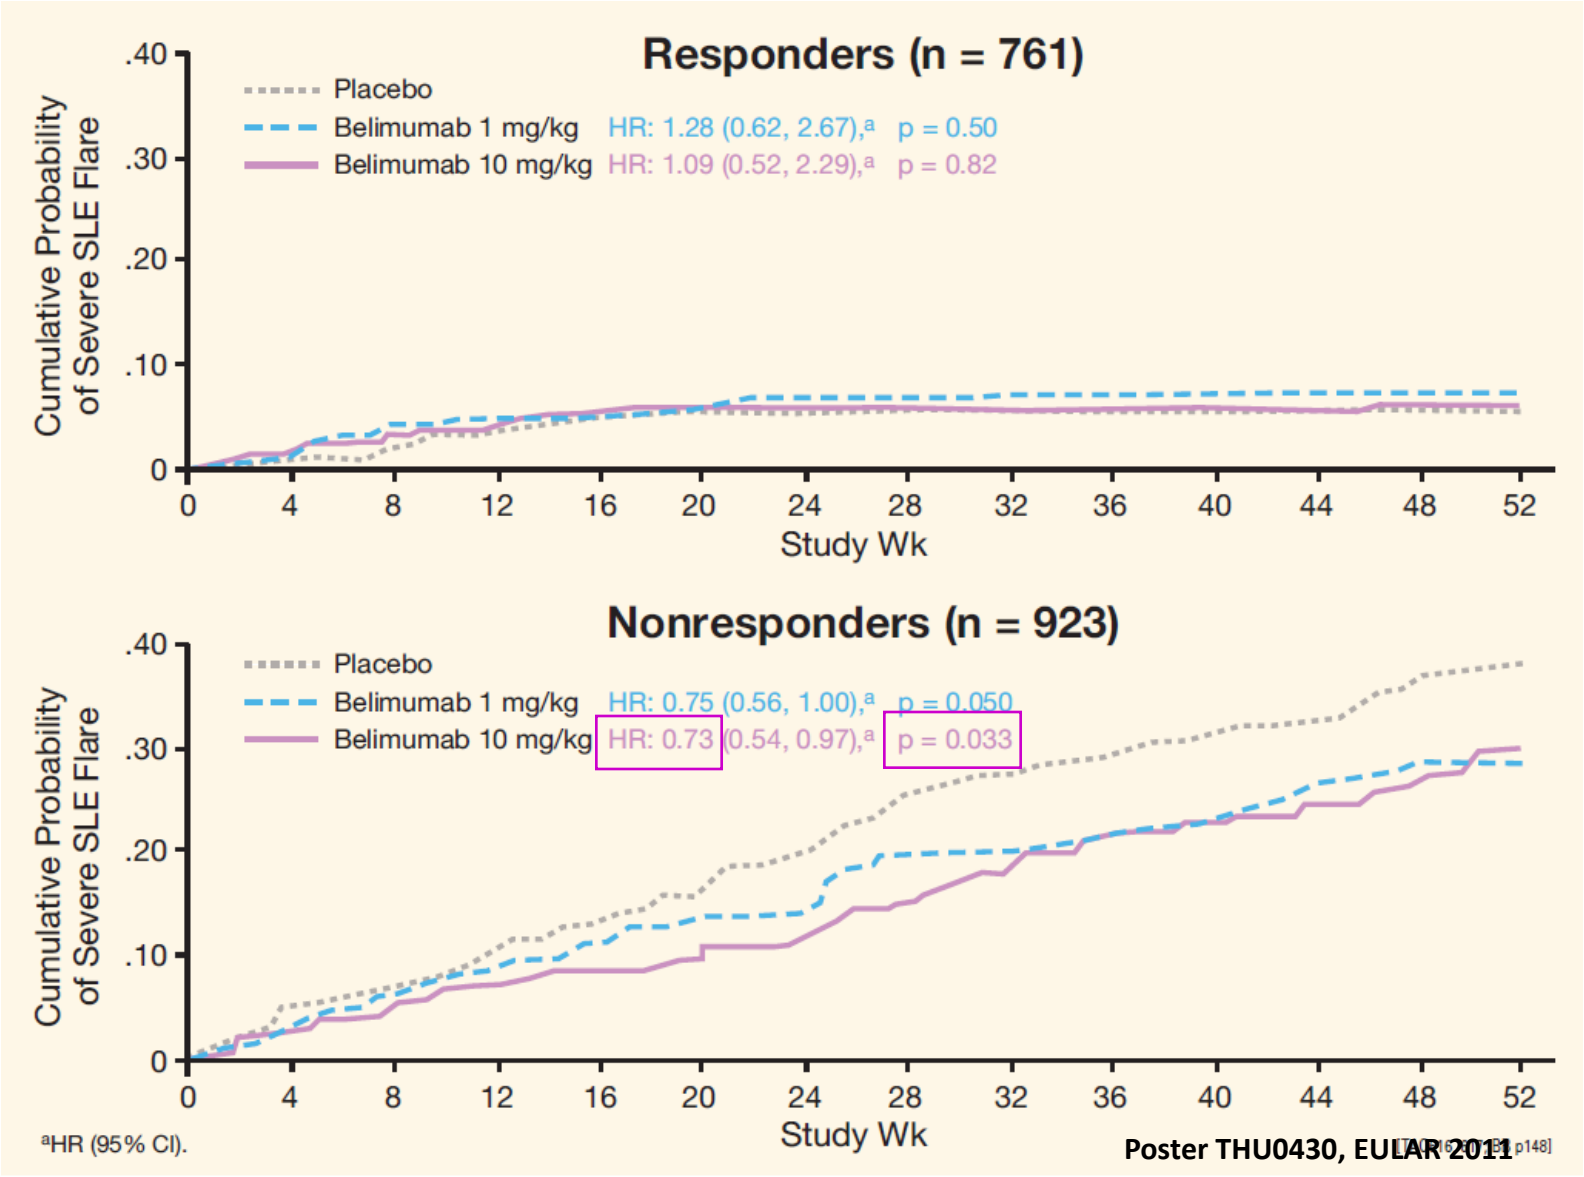


Reduction of glucocorticoids



The risk for increasing the dose of GC was significantly lower in belimumab- vs. placebo-treated patients (HR 0.65; 0.52, 0.81, p=0.0001)

Belimumab reduces the risk for severe flare irrespective of improvement in disease activity



Poster THU0430, EULAR 2011

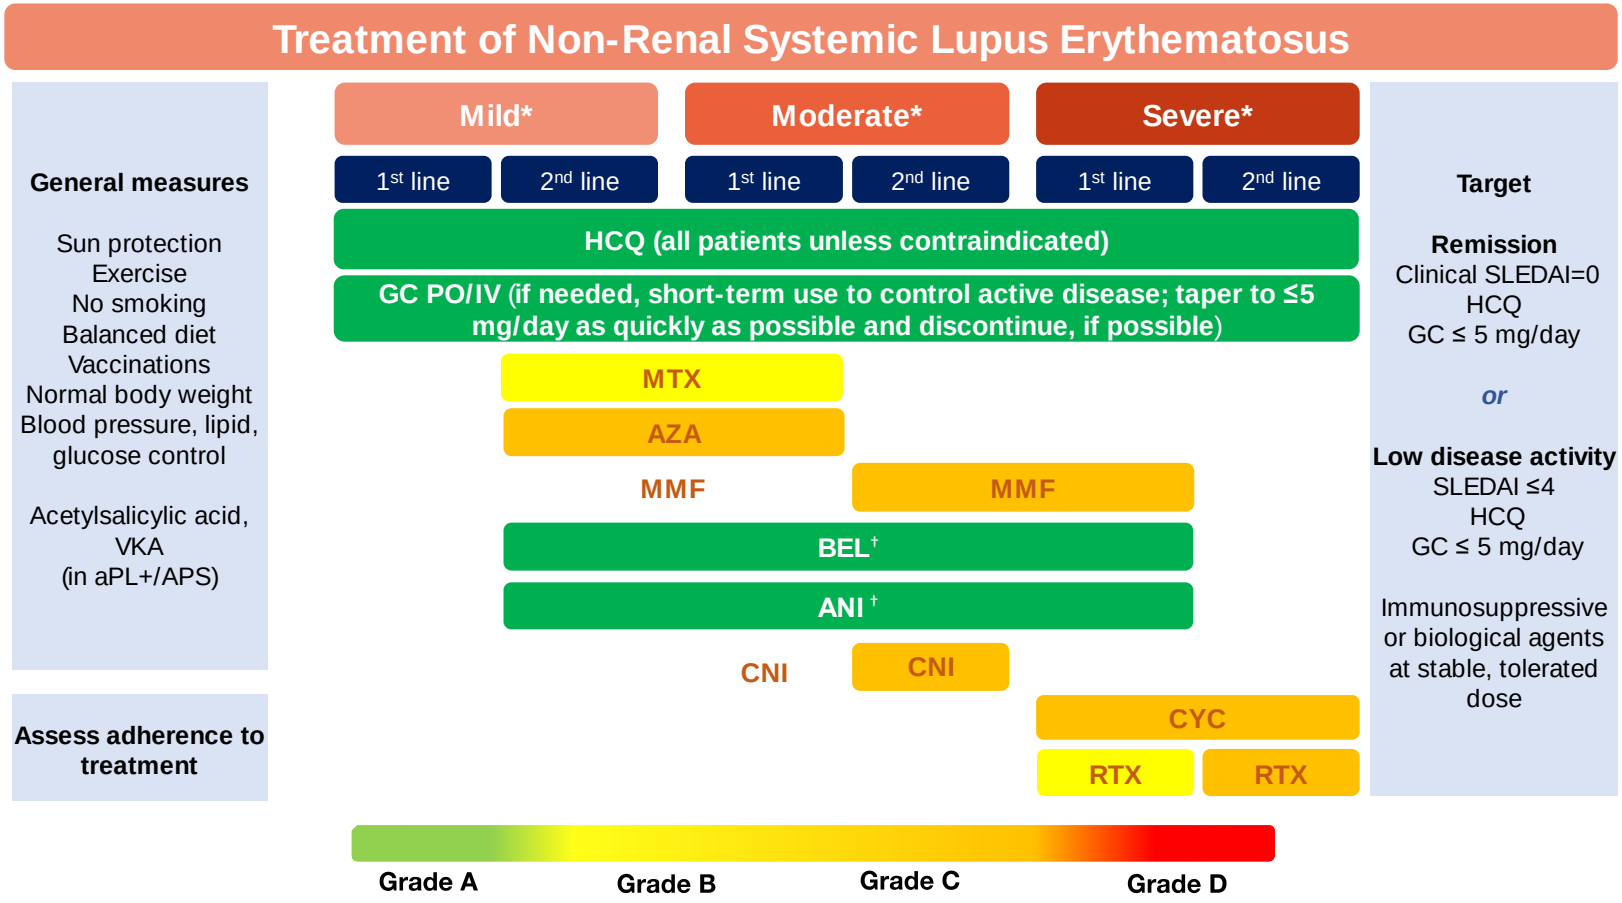
2023 Update of the EULAR SLE recommendations



"In patients not responding to hydroxychloroquine (alone or in combination with glucocorticoids) or patients unable to reduce glucocorticoids below doses acceptable for chronic use, addition of immunomodulating/immunosuppressive agents (for example methotrexate [1b/B], azathioprine 2b/C] or mycophenolate [2a/B]) and/or biologic agents (for example, belimumab [1a/A] or anifrolumab [1a/A]) should be considered."

Who might be the (best) candidates for treatment with biological agents?

- Patients with high clinical burden (ie, multiple involved organs, high disease activity or severity)
- Serologically active patients
- Patients requiring chronic treatment with glucocorticoids (inability to reduce <7.5 mg/day after 3-6 months)
- Early disease (i.e., within the first 2 since diagnosis/onset)
- Younger patients

Συμπεράσματα

- Η φυσική πορεία του ΣΕΛ συχνά περιπλέκεται με αρνητικές εκβάσεις τόσο για την ίδια τη νόσο όσο και τους ασθενείς
- Η βελτίωση της πρόγνωσης είναι εφικτή μέσω επίτευξης χαμηλής κλινικής ενεργότητας ή ύφεσης με χαμηλή δόση γλυκοκορτικοειδών (≤5 mg/ημ. πρεδνιζόνη)
- Νεότεροι βιολογικοί παράγοντες όπως το belimumab και το anifrolumab βοηθούν σημαντικά στην παραπάνω προσπάθεια
- Αυξανόμενα δεδομένα ευνοϊκού προφίλ ασφάλειας και αποτελεσματικότητας των βιολογικών παραγόντων δημιουργούν προϋποθέσεις για αλλαγή του «θεραπευτικού παραδείγματος» στο ΣΕΛ με την πρώιμη χρήση τους
